                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to an isolated nuclectide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a specitin gene, H1 and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophin minigene delta3990 containing nucleotides 1.1668 (N-terminus, hinge H1 and rode R1 and R2), 8059-10227 (rods R22, R23 and R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               420

Example 1; Page 59-60; 71pp; English

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is useful for treating buchenne muscular dystrophy (BMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophin minigenes, a muscle creatine kinase (MCK) promoter and a small polyA signal sequence

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Draft entry and computer-readable sequence kindly provided by
Knosnig, 01-APR-1988 The severity of muscular dystrophy is
determined by the size of the deleted DNA segment. Deletions found
in different patients were from positions 302-2200, 473-1168,
1691-1810, and 1169-3011.

// Madison, Wi. cultured according to their instructions, on MEF feeders. They formed round colonies with defined edges and were positive for alkaline phosphatase, SSBA-4, OCT3, OCT4, WTF, TERY, GATA4, PDX1, NCAM, MSX1, FLD3, SSEA-1, TUBB3. NES, GFAP, and EOWES. When confluent (18-10 days after plating), the ES cells from 4 x Com dishes were treated with I mg/ml collagenase, type IV (Invitrogen. Protocol ref. Genome Res. II: 1553-1558 (2001). [PMD: 1154499]) Double-stranded cDNAs were synthesized with an Oligo (dT) primer [Invitrogen. Protocol ref. Genome Res. II: 1553-1558 (2001). [PMD: 1154499]) Double-stranded cDNAs were ligated to Lone-linker Li-Sal4, purified by phenol/chloroform extraction, and separated from free linkers by centration. The conna were amplified by long-range high fidelity PRK using Ex Taq polymerase (Takara) with a primer Sal4, purified by phenol/chloroform extraction and centrion-100 column. Then, the cDNAs were amplified by long-range high fidelity PRK using Ex Taq polymerase (Takara) with a primer Sal4. Sfor 25 cycles. The products were purified by phenol/chloroform extraction and centrion-100 column. The cDNAs were digested with Sal and NoII enzymes and cloned into Sal1/NoII site of sabout 3.6kb."
